CO-1 AT-1

Short Answers Test

Name: T. Varun Tej

Reg No:- 192511217

Course: Computer Vision

Code: ITA0502

1) Low Spatial Resolution

The small objects are appearing unclear because of low spatial rate. So by increasing the rate of spatial resolution we can see the small objects very clear through the small camera.

2) Surveillance :-

The image is dark & noisy because of the low brightness. Use the histogram quantization to improve the brightness, so that we can get a clear image in dark

3) Medical Image:

This image contains infinite intensity values. So if we convert that infinite into finite intensity values, we can see the image very easily.

4) Industrial Camera:

The ~~pic~~ picture of an product in uneven lighting makes some defects to see image. So using histogram quantization for improving brightness. We can see image perfectly even in uneven lighting.

5) Self - Driving Car

Using image segmentation in autonomous cars helps in identifying the objects on road such as divider, signals, cars and footpath for safe driving.

6) Factory Inspection:

The cracks on products are easy to identify if we use an edge detector. The best one to use is canny edge detector by observing the surface of product.

7) Medical Image

The best suitable filtering technique for detecting an tumor is median filter. It helps in identifying the edges b/w tumor & healthy organs

8) Traffic Monitoring:

Using object detection helps us to identify to track vehicles, traffic density etc. It is also used in GPS for navigation purposes.

9) Image capturing

The image is blurred because of object movement during acquisition. The best method to improve the image is deblurring.

10) Industrial Vision:

Image classification is soo - important in industry for finding out the good & bad products. It helps us for quick inspection and quick delivering by seperating them.
